Bangalore House Price Prediction

Steps I Followed:

- Load Data
- Data Cleaning: Handle NA values
- Feature Engineering
- Dimensionality Reduction
- Outlier Removal Using Business Logic
- Outlier Removal Using Standard Deviation and Mean
- Analyze By plotting
- Build Model

Data Source:

https://www.kaggle.com/amitabhajoy/bengaluru-house-price-data

Data Science Regression Project: Predicting Home Prices in Banglore

Dataset is downloaded from here: https://www.kaggle.com/amitabhajoy/bengaluru-house-price-data

```
import pandas as pd
import numpy as np
from matplotlib import pyplot as plt
%matplotlib inline
import matplotlib
matplotlib.rcParams["figure.figsize"] = (20,10)
```

Data Load: Load banglore home prices into a dataframe

```
In [2]:
    df1 = pd.read_csv("bengaluru_house_prices.csv")
    df1.head()
```

Out[2]:		area_type	availability	location	size	society	total_sqft	bath	balcony	price

location_stats.values.sum()

Dimensionality Reduction

Any location having less than 10 data points should be tagged as "other" location. This way number of categories can be reduced by huge amount. Later on when we do one hot encoding, it will help us with having fewer dummy columns

```
In [27]:
          location_stats_less_than_10 = location_stats[location_stats<=10]</pre>
          location stats less than 10

Outlier Removal Using Business Logic

As a data scientist when you have a conversation with your business manager (who has expertise in real estate), he will tell you that normally square ft per bedroom is 300 (i.e. 2 bhk apartment is minimum 600 sqft. If you have for example 400 sqft apartment with 2 bhk than that seems suspicious and can be removed as an outlier. We will remove such outliers by keeping our minimum thresold per bhk to be 300 sqft

In [31]:	df:	df5[df5.total_sqft/df5.bhk<300].head()												
Out[31]:		location	size	total_sqft	bath	price	bhk	price_per_sqft						
	9	other	6 Bedroom	1020.0	6.0	370.0	6	36274.509804						
	45	HSR Layout	8 Bedroom	600.0	9.0	200.0	8	33333.333333						
	58	Murugeshpalya	6 Bedroom	1407.0	4.0	150.0	6	10660.980810						
	68	Devarachikkanahalli	8 Bedroom	1350.0	7.0	85.0	8	6296.296296						
	70	other	3 Bedroom	500.0	3.0	100.0	3	20000.000000						

Check above data points. We have 6 bhk apartment with 1020 sqft. Another one is 8 bhk and total sqft is 600. These are clear data errors that can be removed safely

Outlier Removal Using Standard Deviation and Mean

```
In [34]:
          df6.price_per_sqft.describe()
Out[34]: count
                    12456.000000
                    6308.502826
         mean
         std
                    4168.127339
                     267.829813
         min
         25%
                    4210.526316
                    5294.117647
         75%
                    6916.666667
                  176470.588235
         max
         Name: price per sqft, dtype: float64
```

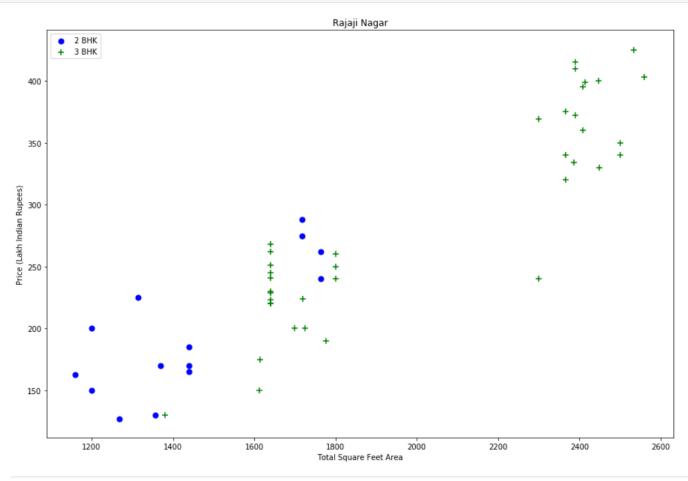

Here we find that min price per sqft is 267 rs/sqft whereas max is 12000000, this shows a wide variation in property prices. We should remove outliers per location using mean and one standard deviation

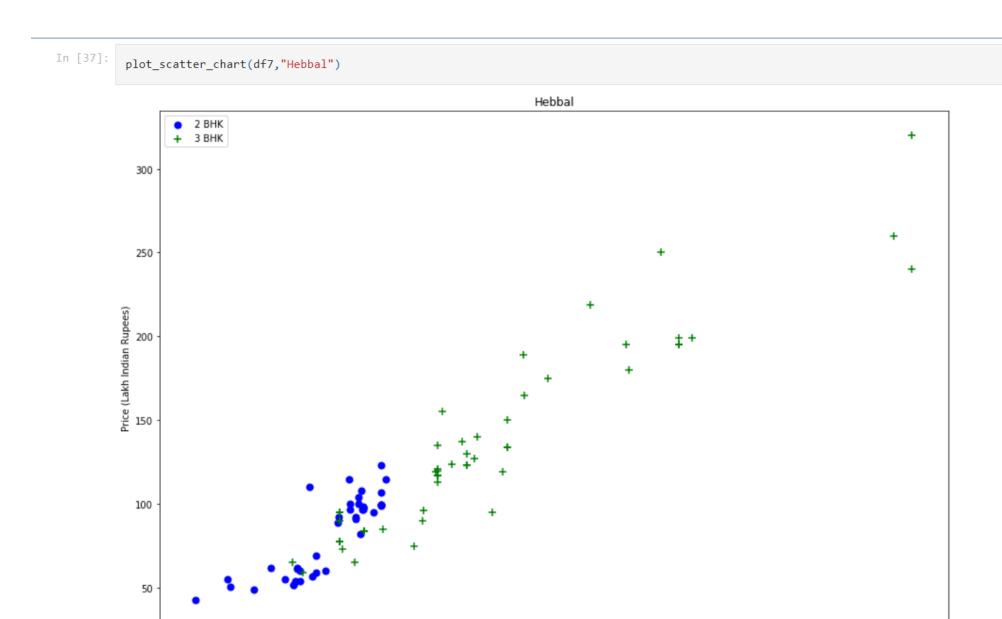

```
def remove_pps_outliers(df):
    df_out = pd.DataFrame()
    for key, subdf in df.groupby('location'):
        m = np.mean(subdf.price_per_sqft)
        st = np.std(subdf.price_per_sqft)
        reduced_df = subdf[(subdf.price_per_sqft>(m-st)) & (subdf.price_per_sqft<=(m+st))]
        df_out = pd.concat([df_out,reduced_df],ignore_index=True)
    return df_out
df7 = remove_pps_outliers(df6)
df7.shape</pre>
```

Out[35]: (10242, 7)

```
def plot_scatter_chart(df,location):
    bhk2 = df[(df.location==location) & (df.bhk==2)]
    bhk3 = df[(df.location==location) & (df.bhk=3)]
    matplotlib.rcParams['figure.figsize'] = (15,10)
    plt.scatter(bhk2.total_sqft,bhk2.price,color='blue',label='2 BHK', s=50)
    plt.scatter(bhk3.total_sqft,bhk3.price,marker='+', color='green',label='3 BHK', s=50)
    plt.xlabel("Total Square Feet Area")
    plt.ylabel("Price (Lakh Indian Rupees)")
    plt.title(location)
    plt.legend()

plot_scatter_chart(df7,"Rajaji Nagar")
```

Total Square Feet Area

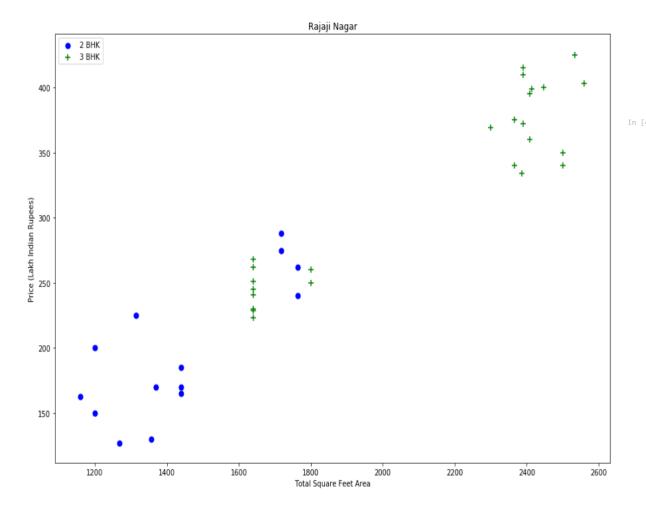

iotal Square i eet Area

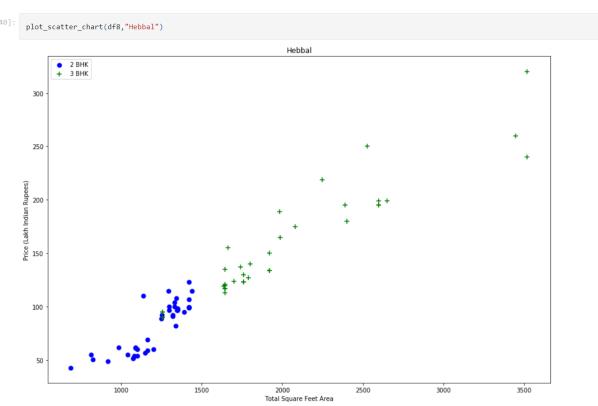

We should also remove properties where for same location, the price of (for example) 3 bedroom apartment is less than 2 bedroom apartment (with same square ft area). What we will do is for a given location, we will build a dictionary of stats per bhk, i.e.

```
{
    '1' : {
        'mean': 4000,
        'std: 2000,
        'count': 34
    },
    '2' : {
        'mean': 4300,
        'std: 2300,
        'count': 22
    },
}
```

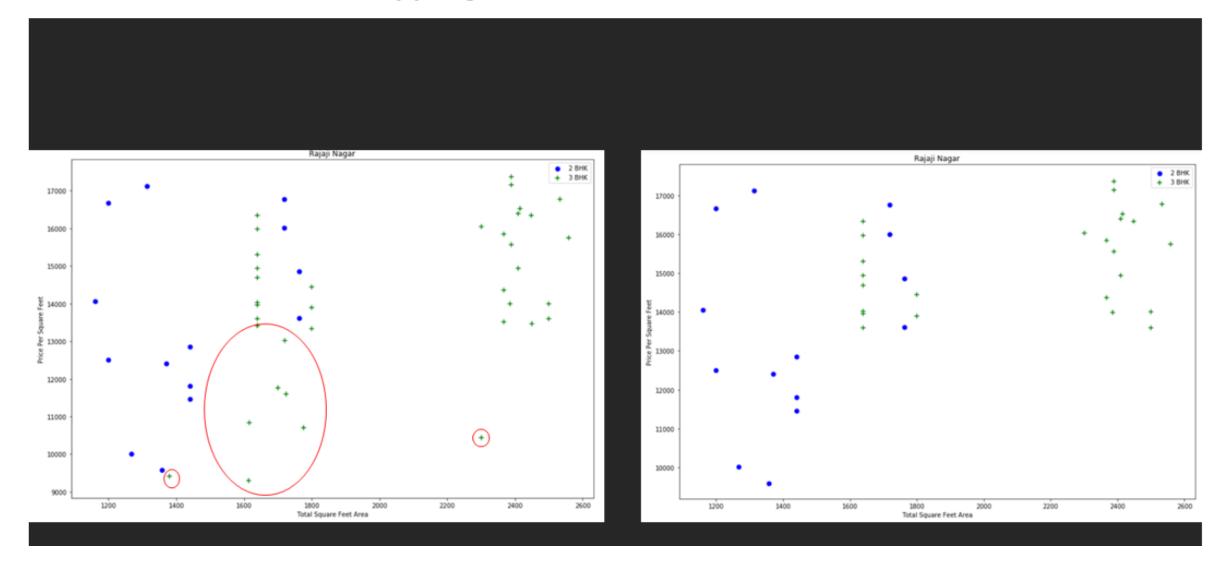

Now we can remove those 2 BHK apartments whose price_per_sqft is less than mean price_per_sqft of 1 BHK apartment

```
In [38]:
          def remove_bhk_outliers(df):
              exclude_indices = np.array([])
              for location, location_df in df.groupby('location'):
                  bhk_stats = {}
                  for bhk, bhk_df in location_df.groupby('bhk'):
                      bhk_stats[bhk] = {
                          'mean': np.mean(bhk_df.price_per_sqft),
                          'std': np.std(bhk_df.price_per_sqft),
                          'count': bhk_df.shape[0]
                  for bhk, bhk_df in location_df.groupby('bhk'):
                      stats = bhk_stats.get(bhk-1)
                      if stats and stats['count']>5:
                          exclude_indices = np.append(exclude_indices, bhk_df[bhk_df.price_per_sqft<(stats['mean'])].index.values)
              return df.drop(exclude_indices,axis='index')
          df8 = remove_bhk_outliers(df7)
          # df8 = df7.copy()
          df8.shape
```

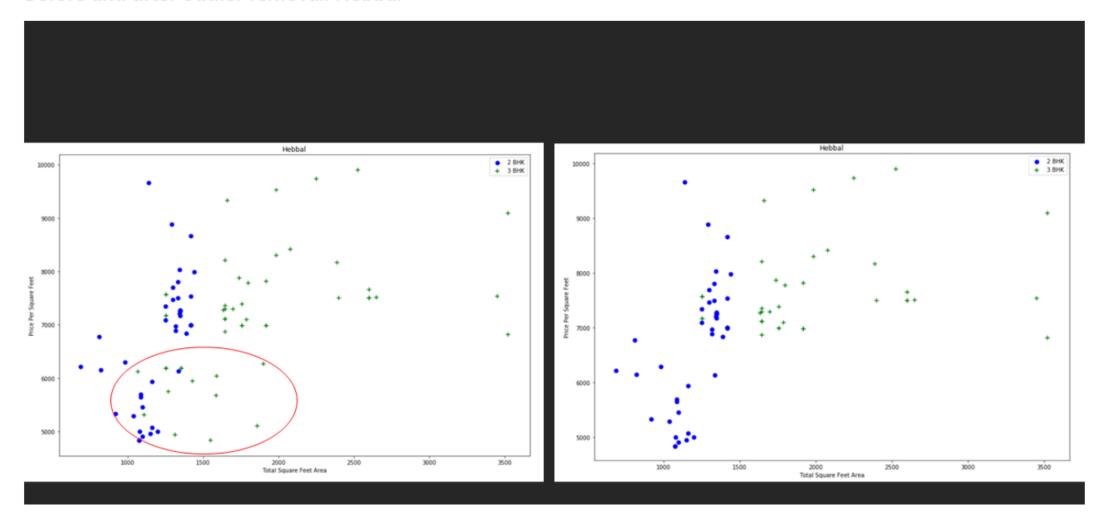

Before and after outlier removal: Rajaji Nagar

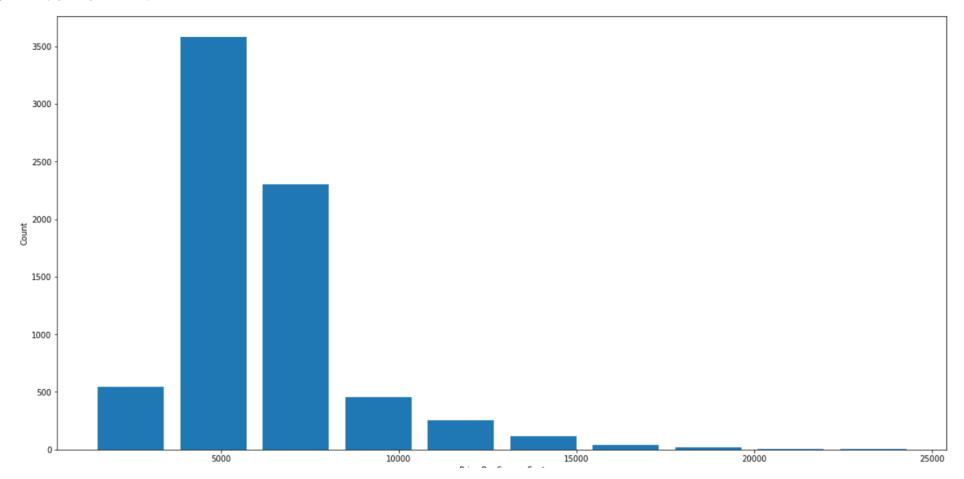

Before and after outlier removal: Hebbal

```
import matplotlib
matplotlib.rcParams["figure.figsize"] = (20,10)
plt.hist(df8.price_per_sqft,rwidth=0.8)
plt.xlabel("Price Per Square Feet")
plt.ylabel("Count")
```

Out[41]: Text(0, 0.5, 'Count')

Outlier Removal Using Bathrooms Feature

```
In [42]:
         df8.bath.unique()
Out[42]: array([ 4., 3., 2., 5., 8., 1., 6., 7., 9., 12., 16., 13.])
In [43]:
         plt.hist(df8.bath,rwidth=0.8)
          plt.xlabel("Number of bathrooms")
          plt.ylabel("Count")
Out[43]: Text(0, 0.5, 'Count')
         4000
         3000
         2000
         1000
                                                                                         10
                                                                                                         12
                                                                                                                         14
```

Number of bathrooms

In [44]:

df8[df8.bath>10]

Out[44]:

	location	size	total_sqft	bath	price	bhk	price_per_sqft		
5277	Neeladri Nagar	10 BHK	4000.0	12.0	160.0	10	4000.000000		
8483	other	10 BHK	12000.0	12.0	525.0	10	4375.000000		
8572	other	16 BHK	10000.0	16.0	550.0	16	5500.000000		
9306	other	11 BHK	6000.0	12.0	150.0	11	2500.000000		
9637	other	13 BHK	5425.0	13.0	275.0	13	5069.124424		

It is unusual to have 2 more bathrooms than number of bedrooms in a home

In [45]:

df8[df8.bath>df8.bhk+2]

Out[45]:

		location	size	total_sqft	bath	price	bhk	price_per_sqft				
1	1626	Chikkabanavar	4 Bedroom	2460.0	7.0	80.0	4	3252.032520				
5	5238	Nagasandra	4 Bedroom	7000.0	8.0	450.0	4	6428.571429				
6	5711	Thanisandra	3 BHK	1806.0	6.0	116.0	3	6423.034330				
8	3408	other	6 BHK	11338.0	9.0	1000.0	6	8819.897689				

Again the business manager has a conversation with you (i.e. a data scientist) that if you have 4 bedroom home and even if you have bathroom in all 4 rooms plus one guest bathroom, you will have total bath = total bed + 1 max. Anything above that is an outlier or a data error and can be removed

```
In [46]:
           df9 = df8[df8.bath<df8.bhk+2]

Out[59]: array([0.82702546, 0.86027005, 0.85322178, 0.8436466 , 0.85481502])

Use K Fold cross validation to measure accuracy of our LinearRegression model

```
from sklearn.model_selection import ShuffleSplit
from sklearn.model_selection import cross_val_score

cv = ShuffleSplit(n_splits=5, test_size=0.2, random_state=0)

cross_val_score(LinearRegression(), X, y, cv=cv)
```

We can see that in 5 iterations we get a score above 80% all the time. This is pretty good but we want to test few other algorithms for regression to see if we can get even better score. We will use GridSearchCV for this purpose

Find best model using GridSearchCV

```
In [60]:
          from sklearn.model selection import GridSearchCV

```

Export the tested model to a pickle file

```
import pickle
with open('banglore_home_prices_model.pickle','wb') as f:
pickle.dump(lr_clf,f)
```

Export location and column information to a file that will be useful later on in our prediction application

```
import json
columns = {
    'data_columns' : [col.lower() for col in X.columns]
}
with open("columns.json","w") as f:
    f.write(json.dumps(columns))
```
